The present invention relates to a method (M1) for identifying genes involved in plant resistance or response to pathogenic infection. M1 comprises identifying a gene whose expression is significantly altered in the incompatible interaction of plant gene expression relative to expression of the gene in an uninfected plant, in a mutant plant that does not express a gene associated with response to pathogenic infection, or in a corresponding incompatible or compatible interaction. (M1) is bacterial, fungal or viral infection. The present sequence was used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 -----ACTGACGTGGTGGTTTCAAA 353
                                                                                                                                                                                                                                                                                                                                                                                                                                                           Identifying at least one gene involved in plant resistance or response pathogenic infection for conferring resistance or tolerance to a plant bacterial, fungal or viral infection by determining or detecting plant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                243 TTTCGCTAACGGAGGATTCTCTTACAATAAAGGCTCAACCAGCCCCGCGTCTACTTTCAA

The present invention relates to a method for stimulating root growth or enhancing the formation of lateral or adventitious roots or altering root of solventh comprises increasing in a plant or plant part the level of a plant cytokinin oxidase or other protein that reduces the level of active cytokinins in a plant or plant part. Cytokinin oxidase protein and coding sequences from Arabidopsis thaliana are also provided. The method is useful in modifying plant morphological, biochemical and physiological properties, such as in modifying the initiation, stimulation or enhancement of root growth, adventitious root formation, lateral root formation, root geotropism, shoot growth, apical dominance, branching, timing of senescence, timing of flowering, flower formation, seed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Stimulating root growth, enhancing lateral or adventitious root formation or altering root geotropism comprises increasing plant cytokinin oxidase levels or other protein or nucleic acid that reduces active cytokinins in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               101

The invention relates to an isolated polymucleotide (I) encoding a novel plant protein (II) having cytokinin oxidase activity. (I) is useful for production of transgenic plants, plant cells or tissues, for production of altered plants, plant cell or tissues, and for effecting the expression of (II) where (I) is operably linked to one or more control sequences. The methods further comprises regenerating a plant from the

plant cell. (1) and (II) are useful for stimulating root growth; enhancing the formation of lateral or adventitious roots; altering root geotropism, leading to an increase in yield; and for screening growth promoting chemical of herbicides. (1) is useful for increasing the size of the root meristem; increasing root size; increasing the size of the shoot meristem; delaying leaf senescence and altering leaf senescence; increasing leaf thickness; reducing or increasing the seesel size; increasing branching and for improving lodging resistance. Antibody (III) to (II) is useful for identifying and obtaining proteins interacting with (II) comprising a screening assay, preferably a two-hybrid screening assay. The present invention relates to a method for stimulating root growth or enhancing the formation of lateral or adventitious roots or altering root of actropiam, which comprises increasing in a plant or plant part the level of active cytokinin oxidase or other protein that reduces the level of active cytokinins in a plant or plant part. Cytokinin oxidase protein and coding sequences from Arabidopsis thaliam are also provided. The method is useful in modifying plant morphological, biochemical and physiological properties, such as in modifying the initiation, stimulation or enhancement of root growth, adventitious root formation, root geotropism, shoot growth, apical dominance, branching, timing of senescence, timing of flowering, flower formation, seed

Polynucleotide encoding novel plant protein having cytokinin oxidase activity and the protein useful for stimulating root growth, enhancing the formation of lateral or adventitious roots, altering root geotropism.

Claim 3; Page 147; 154pp; English.

The invention relates to an isolated polymuclectide (I) encoding a novel plant protein (II) having cytckinin oxidase activity. (I) is useful for production of transpenic plants, plant cells or tissues; for production of alcered plants, plant cells or tissues; nor production of alcered plants, plant cell or tissues; and for effecting the expression of (II) where (I) is operably linked to one or more control plant cell. (I) and (II) is operably linked to one or more control plant cell. (I) and (II) are useful for stimulating root growth, contaming the formation of fateral or adventitious roots; altering root gentropism, leading to an increase in yield; and for increasing the size of the root meristerm; horizensing root size; increasing the size of the shoot meristerm; delaying leaf senescence and altering leaf senescence; increasing leaf thickness; reducing or increasing the vessel size; increasing branching and for improving lodging resistance. Antibody (III) to comprishing a screening and obtaining proteins interacting with (II) is useful for identifying and obtaining proteins interacting with (II) comprishing a screening assay, packerably a two-hybrid screening coding sequences and PCR primers of the invention

Ë Schmulling T, Werner WPI; 2003-541577/51.

WERN/) WERNER T.

Stimulating root growth, enhancing lateral or adventitious root formation or altering root geotropism comprises increasing plant cytokinin oxidase levels or other protein or nucleic acid that reduces active cytokinins in plant

Page 168-169; 177pp; English 3; Claim

The present invention relates to a method for stimulating root growth or enhancing the formation of lateral or adventitious roots or altering root geotropism, which comprises increasing in a plant or plant part the level of a plant cytokinin oxidase or other protein that reduces the level of active cytokinins in a plant or plant part. Cytokinin oxidase protein and coding sequences from Arabidopsis thaliana are also provided. The method is useful in modifying plant morphological, biochemical and physiological properties, such as in modifying the initiation, stimulation or enhancement of root growth, adventitious root formation, lateral root formation, root geotropism, shoot growth, apical dominance, branching, timing of senescence, timing of flowering, flower formation, seed development and/or seed yield. The present sequence is a coding sequence shown in the invention

Sequence 1572 BP; 461 A; 327 C; 348 G; 436 T; 0 U; 0 Other;

This sequence encodes a Zea mays cytckinin oxidase, ckx1. This gene is used to generate transgenic plants in which cytckinin-associated pathogenesis or growth behaviour is altered. Particularly applications include generation of plants with increased resistance to fungi and nematodes, increased grain yield and superior secondary growth properties. Host cells are used for production of recombinant ckx1 mucleic acid which is useful in an assay for determining cytckinin concentrations, and for its studying effects on plant growth and metabolism, including senescence 209 CTCGTCTCCTCCAATACGG----CGCAAACGGAAAAAGTACATTCCAAGTAGCGGCTCGTG Cytokinin oxidase; ckx1; transgenic plant; altered growth behaviour; cytokinin-associated pathogenesis; resistance; fungi; nematode; assay; grain yield; secondary growth; metabolism; senescence; ss. 89 cccitaaccicacccicictacccaicciiccaicaicticccaccaccicaicaica 149 garacataracaccargaccacacagacagarartaracacaracacacagarara New cytokinin oxidase from maize - used to generate transgenic plants with, e.g. better disease resistance and growth characteristics. 72; Query Match

The invention relates to an isolated polynucleotide (I) encoding a novel content protein (II) having cytckinin oxidase activity. (I) is useful for plant protein (II) having cytckinin oxidase activity. (I) is useful for production of transgenic plants, plant cells or tissues; for production of altered plants, plant cells or tissues; and for effecting the compression of [II) where (II) is operably linked to one or more control sequences. The methods further comprises regenerating a plant from the companies. The methods further comprises regenerating a plant from the companies. The methods further comprises regenerating a plant from the companies. The methods further comprises regenerating a plant from the companies, leading to a increase in yield; and for screening growth companies increasing to an increase in yield; and for screening define size of the content meristem; delaying leaf senescence and altering leaf senescence; content increasing branching and for improving lodging resistance. Antibody (III) increasing branching and for improving lodging resistance. Antibody (III) increasing branching and for improving lodging resistance. Antibody (III) comprising a screening assay, horeferably a two-hybrid screening cassay, abszas606-ABK28631 represent Arabidopsis thaliana cytokinin oxidase coding sequences and PCR primers of the invention Claim 3; Page 148-149; 154pp; English.

ALIGNMENTS

An Arabidopsis full-length cDNA library was constructed essentially as reported previously (Seki et al., 1998). CDNA cleaved with BamHI and XhoI was ligated to modified Lambda FLC-1 vector (Carninci et al., submitted for publication) digested with BamHI and Sall. This clone is in a modified pBluescript vector. Please visit our web site (http://www.gsc.riken.go.jp/e/plant/index_e.html) for further details.

Polynuclectide encoding novel plant protein having cytokinin oxidase activity and the protein useful for stimulating root growth, enhancing the formation of lateral or adventitious roots, altering root geotropism.

Claim 12, Page 129-131; 154pp; English.

The invention relates to an isolated polynucleotide (I) encoding a novel plant protein (II) having cytokinin oxidase activity. (I) is useful for production of transgenic plants, plant cells or tissues; for production of altered plants, plant cell or tissues; and for effecting the expression of (II) where (I) is operably linked to one or more control sequences. The methods further comprises regenerating a plant from the plant cell. (I) and (II) are useful for stimulating root growth, enhancing the formation of lateral or adventitious roots; altering root

geotropism, leading to an increase in yield; and for screening growth promoting chemical of herbicides. (1) is useful for increasing the size of the root meristem; increasing root size; increasing the size of the shoot meristem; delaying leaf senescence and altering leaf senescence; increasing leaf thickness; reducing or increasing the vessel size; increasing branchencarpy; improving standability of the seedlings; increasing branching and for improving lodging resistance. Antibody (III) (II) comprising a screening assay, preferably a two-hybrid screening assay. AAU81967-AAU81974 represent Arabidopsis thaliana cytokinin oxidase

The present invention relates to a method for stimulating root growth or enhancing the formation of lateral or adventitious roots or altering root geotropism, which comprises increasing in a plant or plant part the level of a plant cytokinin oxidase or other protein that reduces the level of active cytokinins in a plant or plant part. Cytokinin oxidase protein and coding sequences from Arabidopsis thaliana are also provided. The method is useful in modifying plant morphological, biochemical and physiological properties, such as in modifying the initiation, stimulation or enhancement of root growth, adventitious root formation, lateral root formation, root geotropism, shoot growth, apical dominance, branching, timing of senescence, timing of flowering, flower formation, seed development and/or seed yield. The present sequence is a protein shown in
                                                                                                                                                                                                                                        Stimulating root growth, enhancing lateral or adventitious root formation or altering root geotropism comprises increasing plant cytokinin oxidase levels or other protein or nucleic acid that reduces active cytokinins in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 480

Fri Apr

The present invention relates to a method for stimulating root growth or enhancing the formation of lateral or adventitious roots or altering root geotropism, which comprises increasing in a plant or plant part the level of a plant cytokinin oxidase or other protein that reduces the level of active cytokinins in a plant or plant part. Cytokinin oxidase protein and coding sequences from Arabidopsis thaliana are also provided. The method properties, such as in modifying the initiation, stimulation or enhancement of root growth, adventitious root formation, or geotropism, shoot growth, apical dominance, branching, timing of senescence, timing of flowering, flower formation, seed development and/or seed yield. The present sequence is a protein shown in the invention Sequence 501 AA; Query Match

P

The invention relates to identifying target proteins (ABB90790-ABB94016) for herbicidally active compounds, comprising aligning and comparing nucleic acid or amino acid sequences from plant with nucleic acid or amino acid sequences from non-plant organisms using suitable search parameters, where plant sequences having an E-value greater by a factor of 3 than the E-value of most similar non-plant sequences are selected. The polypeptides or nucleic acids encoding them are useful for identifying modulators. The identified modulators are useful as

Identifying plant target proteins for herbicidally active compounds, comprising aligning and comparing nucleic acid or amino acid sequences from plant with nucleic acid or amino acid sequences from non-plant organisms.

The invention relates to identifying target proteins (ABB90790-ABB94016) for herbicidally active compounds, comprising aligning and comparing nucleic acid or amino acid sequences from plant with nucleic acid or amino acid sequences from plant organisms using suitable search parameters, where plant sequences having an E-value greater by a factor of 3 than the E-value of most similar non-plant sequences are selected. The polypeptides or nucleic acids encoding them are useful for identifying modulators. The identified modulators are useful as Identifying plant target proteins for herbicidally active compounds, comprising aligning and comparing nucleic acid or amino acid sequences from plant with nucleic acid or amino acid sequences from non-plant Claim 5; SEQ ID NO 2372; 261pp + Sequence Listing; English Herbicidally active polypeptide SEQ ID NO 2372. The invention relates to an isolated polymucleotide (I) encoding a novel compared protein (II) having cytokinin oxidase activity. (I) is useful for production of transgenic plants, plant cells or tissues; for production of altered plants, plant cells or tissues; for production of altered plants, plant cell or tissues; and for effecting the capression of (II) where (I) is operably linked to one or more control sequences. The methods further comprises regenerating a plant from the plant cell. (I) and (II) are useful for stimulating root growth; chancing the formation of lateral or adventitious roots; altering root geotropism, leading to an increase in yield; and for screening growth promoting chemical of herbicides. (I) is useful for increasing the size of the root meristem; increasing root size; increasing the size of the shoot meristem; delaying leaf sensecence and altering leaf thickness; reducing or increasing the vessel size; increasing barthenocarpy; improving standability of the seedlings; increasing branching and for improving scandability of the seedlings; to (II) is useful for identifying and obtaining proteins interacting with a size; and constraint and screening assay, preferably a two-hybrid screening assay, preferably a two-hybrid screening assay. Polynucleotide encoding novel plant protein having cytokinin oxidase activity and the protein useful for stimulating root growth, enhancing the formation of lateral or adventitious roots, altering root geotropism Claim 2; Page 135-137; 154pp; English.

enhanding the formation of lears of adventitious roots or altering root geotropism, which comprises increasing in a plant or plant part the level of a plant cytokinin oxidase or other protein that reduces the level of active cytokinins in a plant or plant part. Cytokinin oxidase protein and coding sequences from Arabidopsis thaliana are also provided. The method is useful in modifying plant morphological, biochemical and physiological properties, such as in modifying the initiation, stimulation or enhancement of root growth, adventitious root formation lateral root formation, root geotropism, shoot growth, apical dominance, branching, timing of senescence, timing of flowering, flower formation, seed development and/or seed yield. The present sequence is a protein shown in

                                                                           셤
                                                                                                                                                                                                                                                                                                                   The present invention relates to a method for stimulating root growth or enhancing the formation of lateral or adventitious roots or altering root of a plant cytokinin coxidase increasing in a plant or plant part the level of a plant cytokinin oxidase or other protein that reduces the level of active cytokinins in a plant or plant part. Cytokinin oxidase protein and coding sequences from Arabidopsis Inhaliana are also provided. The method is useful in modifying plant morphological, biochemical and physiological properties, such as in modifying the initiation, stimulation or enhancement of root growth, adventitious root formation, lateral root formation, root geotropism, shoot growth, apical dominance, branching, timing of senescence, timing of flowering, flower formation, seed development and/or seed yield. The present sequence is a protein shown in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           346 HVBENKIRSLGLWELPHPWINLYVPKSRILDFHNGVVKDILLKQKSASGLALLYPINRNK 405

PT from plant with nucleic acid or amino acid sequences from non-plant XX XX PS Claim 5; SEQ ID NO 3058; Z61pp + Sequence Listing; English.

XX XX Claim 5; SEQ ID NO 3058; Z61pp + Sequence Listing; English.

XX C The invention relates to identifying target proteins (ABB90790-ABB94016)

CC or nucleic acid or amino acid sequences from plant with nucleic acid or amino acid sequences from plant with nucleic acid or concern acid sequences from plant with nucleic acid or parameters, where plant sequences having an E-value greater by a factor of 3 than the B-value of most similar non-plant sequences are selected.

CC of 3 than the B-value of most similar non-plant sequences are selected.

CC dentifying modulators. The identified modulators are useful as companied to the polypeptides.

XX Sequence 523 AA;

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

probable cytokinin oxidase [imported] - Arabidopsis thaliana
NyAlternate names: hypothetical protein 7326.3
NyAlternate names: hypothetical protein 7326.3
NyAlternate names: hypothetical protein 7326.3
C;Species: Arabidopsis thaliana (mouse-ear cress)
C;Accession: T00807; F84842
R;Rounsley, S.D.; Lin, X.; Ketchum, K.A.; Crosby, M.L.; Brandon, R.C.; Sykes, S.M.; Kaul.
Submitted to the EMBL Data Library, November 1997
A;Description: Arabidopsis thaliana chromosome II BAC 73266 genomic sequence.
A;Reference number: 214163
A;Reference number: 214163
